HE2NW40 polypeptides and polynucleotides are useful C for diagnosing diseases related to over or underexpression of C HE2NW40 protein by identifying mutations in the HE2NW40 gene, C and/or analysing the presence or amount of expressed polypeptide (claimed). HE2NW40 polypeptides, polynucleotides (gene therapy), C antisense sequences, agonists and antagonists, and soluble polypeptides that bind the HE2NW40 ligand to prevent expression, C can be used to modulate HE2NW40 expression or activity. Diseases of diagnosed, prevented or treated include cancer, inflammation, sthma, wasting diseases, atherosclerosis, stroke, diabetes, rithritis, and neurodegenerative diseases and disorders including Alzheimer's disease. HE2NW40 polynucleotides can also be utilised in the recombinant production of HE2NW40 polypeptides.

HE2NW40 cDNA can obtained from a cDNA library derived from mRNA in cells of human neutrophils, adipose or synovial tissue, using expressed sequence tag analysis. HE2NW40 polypeptides and polynucleotides are useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is the nucleotide sequence of an expressed sequence tag (EST) Colone. A polypeptide encoded by the clone is provided in AAW88455. Colaimed polynucleotides may comprise a nucleotide sequence which the hard tleast 70% identity to this sequence. Such polynucleotides can be obtained from a cDNA library derived from mRNA in cells of human neutrophils, adipose or synovial tissue, using expressed sequence tag analysis. A polynucleotide encoding a serine protease termed HEZNW40 (see W884453) is specifically claimed. HEZNW40 polypeptides and polynucleotides are useful for diagnosing diseases related to over or underexpression of HEZNW40 protein. They can hiso be used to modulate HEZNW40 activity. Diseases diagnosed, prevented or treated include cancer, inflammation, asthma, wasting diseases, atherosclerosis, stroke, diabetes, arthritis, and neurodegenerative diseases and disorders including Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Align seg 1/1 to: AAX06944

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               has at least 70% identity to this sequence. Such polynucleotides can be obtained from a cDNA library derived from mRNA in cells of human neutrophils, adipose or synovial tissue, using expressed sequence tag analysis. A polynucleotide encoding a serine procease termed HE2NW40 (see W884453) is specifically claimed. HE2NW40 polypeptides and polynucleotides are useful for diagnosing diseases related to over or underexpression of HE2NW40 protein. They can also be used to modulate HE2NW40 activity. Diseases diagnosed, revented or treated include cancer, inflammation, asthma, wasting hiseases, atherosclerosis, stroke, diabetes, arthritis, and neurodegenerative diseases and disorders including Alzheimer's
                                                                            351

                                                                                                                The invention relates to novel serine proteases designated BSSP4 (AABIL700-B11709), and to nucleic acids encoding them (AAA61695-A61704, AAA61799). The invention also relates to vectors and transformants comprising BSSP4 nucleic acids; transgenic animals in which the expression level of BSSP4 can be varied; and an mBSSP4 knockout mouse. The invention additionally encompasses anti-SSP4 antibodies and methods of production of such antibodies, methods of BSSP4 detection using the antibodies, and the use of BSSP4 proteins or fragments as diagnostic markers for certain medical conditions. Nucleotides encoding BSSP4 were not the conditions. Nucleotides encoding BSSP4 were
proteases. The BSSP4 serine proteases and nucleotides encoding them are useful in detecting homologues, mutants and polymorphic variants in biological samples (e.g., blood, urine, brain, prostate gland and testis) as diagnostic markers for diseases associated with altered BSSP4
                                                                                                                                                                                                                                                                                                                                                       Serine protease BSSP4 diagnosis of diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     641
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               initially isolated in a human brain cDNA library using degenerate PCR primers (AAA61714-A61715) based on conserved regions of serine

(HUMA-) HUMAN GENOME SCI INC

CA, Barash SC,

WPI; 2001-465566/50. P-PSDB; AAU23215.

Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous

Claim 4; SEQ ID No 311; 1180pp; English.

CC The present invention relates to the isolation of novel human enzyme CC polypeptides (AAU22915-AAU23814), and the cDNA and genomic sequences cc encoding them. The enzyme polypeptides of the invention may comprise the CC functional classes of oxidoreductases, transferases, hydrolases, lyases, CC isomerases or ligases. The sequences of the invention are useful in the C diagnosis, treatment, prevention and/or prognosis of a wide range of CC disorders including hyperproliferative disorders (e.g. cancer), CC immunodeficiency disorders (e.g. ALDS) autoimmune disorders (c.g. arthritis), neurological disorders (e.g. Alzheimer's disease), CC (e.g. arthritis), neurological disorders (e.g. Alzheimer's disorders (c.g. arthritis), cardiovascular disorders (e.g. atherosclerosis), CC blood-related disorders (e.g. haemophilia), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The CC (e.g. infertility) and infectious disorders (e.g. influenza) in the CC polynucleotides of the invention can also be used in gene therapy. CC AAS40785-AAS41684 represent cDNA sequences encoding for the novel human contains the containers of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences.

polypeptides and polynucleotides useful as diagnostic reagents lose diseases or disorders associated with aberrant expression or trying polypeptides, for treating blood clotting disorder, or ξ

The invention relates to isolated nucleic acid molecules and their concoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, crabbits, goats, horses, cats, dogs, chickens or sheep. They care also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in cliquous combant assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders c.g. cardiac arrest, or increase and fungi cand ocular disorders e.g. corneal infection, and many other candocular disorders e.g. corneal infection, and many other cornect skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to capabilities, fat content, lipid, protein, carbohydrate, vitamins, mice. minerals, cofactors and fat content, lip actors and other pid, protein, carbohydrat
nutritional components. The present

                  This is the nucleotide sequence of cDNA clone DNA43318 (ATCC 209481) coding for human PRO343 (UNQ302) (see AAY06482). The clone was isolated from a foetal lung library. Amplification of DNA43318 (chromosome 16) was observed in primary lung and primary colon tumours, suggesting an association with tumour formation or growth. Antagonists (e.g. antibodies) directed against PRO343 may have utility in cancer therapy. The invention identifies 14 genes (see AAX87254-67) that are amplified in the genome of tumour cells. Such amplification is expected to be associated with overexpression of the gene product and to contribute to tumorigenesis. The encoded proteins (see AAX06477-90) may be useful targets for the diagnosis and/or treatment (including prevention) of certain cancers, and may cat as predictors of the prognosis of tumour treatment.

Patent No. 6274366
GENERAL INFORMATION:
APPLICANT: Maffitt, Mark A.
APPLICANT: Miles, Andrew L.
APPLICANT: Haak-Frendscho, Mary
TITLE OF INVENTION: Enzymatically-Active Recombinant Human
TITLE OF INVENTION: Beta-Tryptase and Method of Making Same
NUMBER OF SEQUENCES: 6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       681 C...AAGGACATCTTTGGAGACATGGTTTGTGCTGGCAATGCCCAAGGCG

                                                                                                                                  CDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to prepare mouse tissues. First strand cDNA was primed with a primer [5, GACAGAGARGCANCCAAKAGCTCTTTTTTTTTTTTTTTYN 3, CDNA was prepared by using trehalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper. CDNA went through one round of normalization to Rot = 10.0 and subtraction to Rot = 10.0.0. Second strand cDNA was prepared with the primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Exploration Research Group, RIKEN Gemomic Sciences Center (GSC), RIKEN Yokohama Institute; 1-7-22 Suehiro-cho, Tsurumi-ku, Yokohama, Kanagawa 230-0045, Japan (E-mail:genome-res@gsc.riken.go.jp, URL:http://genome.gsc.riken.go.jp/, Tel:81-45-503-9222, Fax:81-45-503-9216)
